

# D lang Interpreter

**Gleb Popov, Timur Usmanov**  
Compiler Construction  
Innopolis University  
Fall 2025

# Project Context

## Dynamic Lang

object types are not specified and can change while program execution

the language assumes **interpretation**

## C++ Language

the implementation language is C++

it provides extensive memory management and optimization features

## Personal parser

hand-written parser

if you want a thing done well, do it yourself :)

# Recall: Lexer

```
var x := 5  
print x
```

```
tkVar tkIdent("x") tkAssign tkIntLiteral(5) tkNewLine  
tkPrint tkIdent tkNewLine
```

```
var t := {x:=1}  
t := t + {y:=2}
```

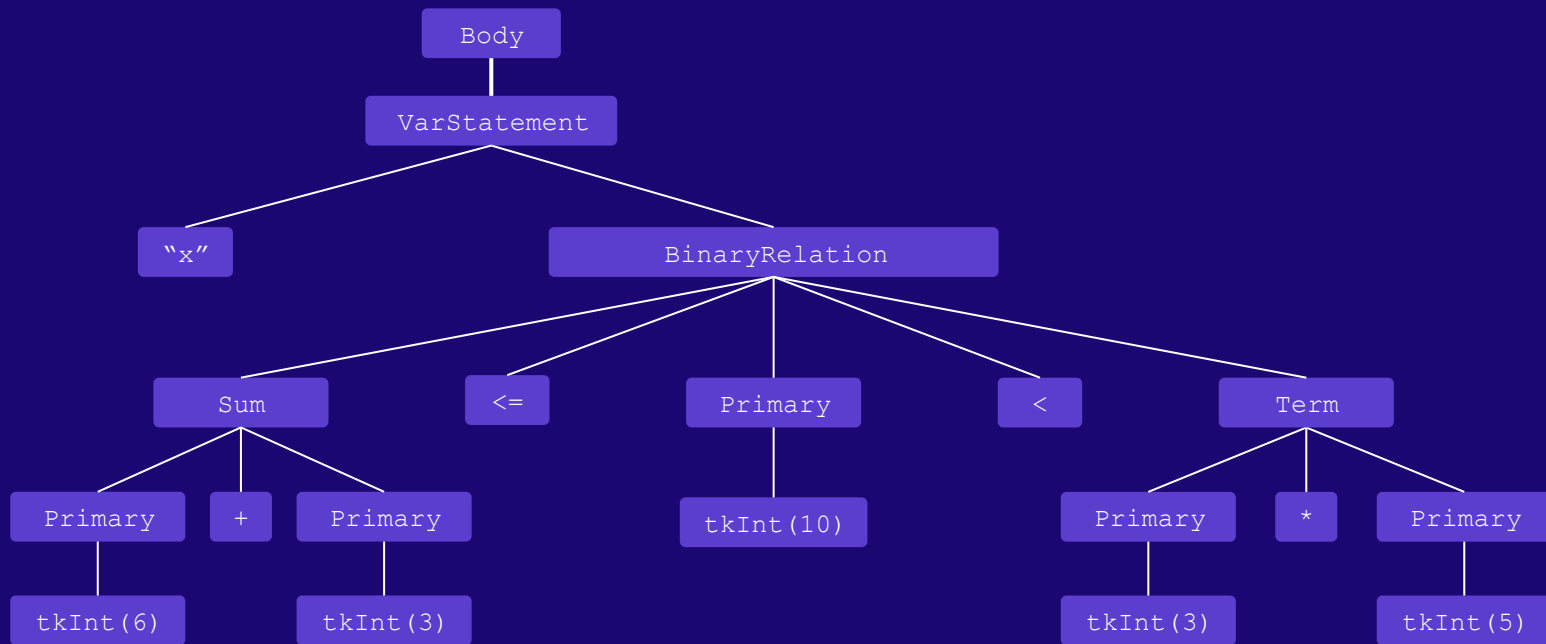

```
tkVar tkIdent(t) tkAssign tkOpenCurlyBrace tkIdent("x")  
tkAssign tkIntLiteral(1) tkClosedCurlyBrace tkNewLine  
tkIdent("t") tkAssign tkIdent("t") tkPlus tkOpenCurlyBrace  
tkIdent("y") tkAssign tkIntLiteral(2) tkClosedCurlyBrace
```

```
var x := 3  
if x < 10 then  
    print "small"  
else  
    print "big"  
end
```

```
tkVar tkIdent("x") tkAssign tkIntLiteral(3) tkNewLine tkIf  
tkIdent("x") tkLess tkIntLiteral(10) tkThen tkNewLine  
tkPrint tkStringLiteral("small") tkNewLine tkElse tkNewLine  
tkPrint tkStringLiteral("big") tkNewLine tkEnd tkNewLine
```

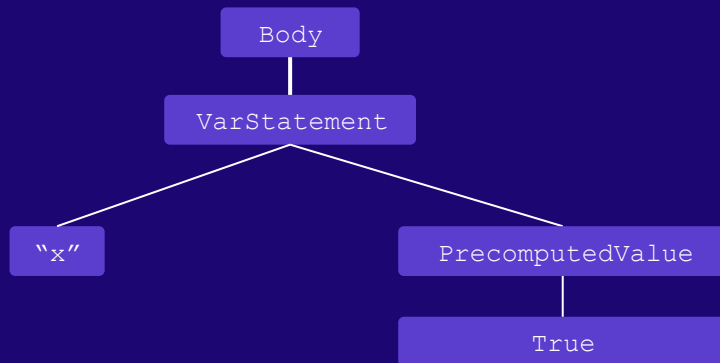

# Recall: Syntax Analyzer

```
var x := 6 + 3 <= 10 < 3 * 5
```

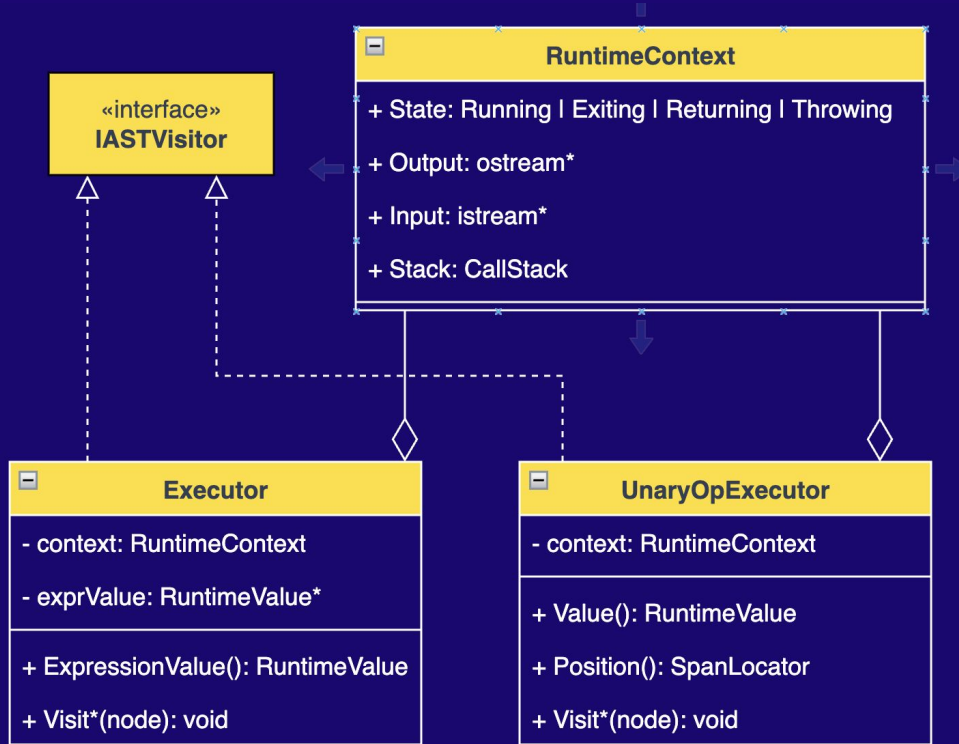

# Recall: Semantic Analyzer

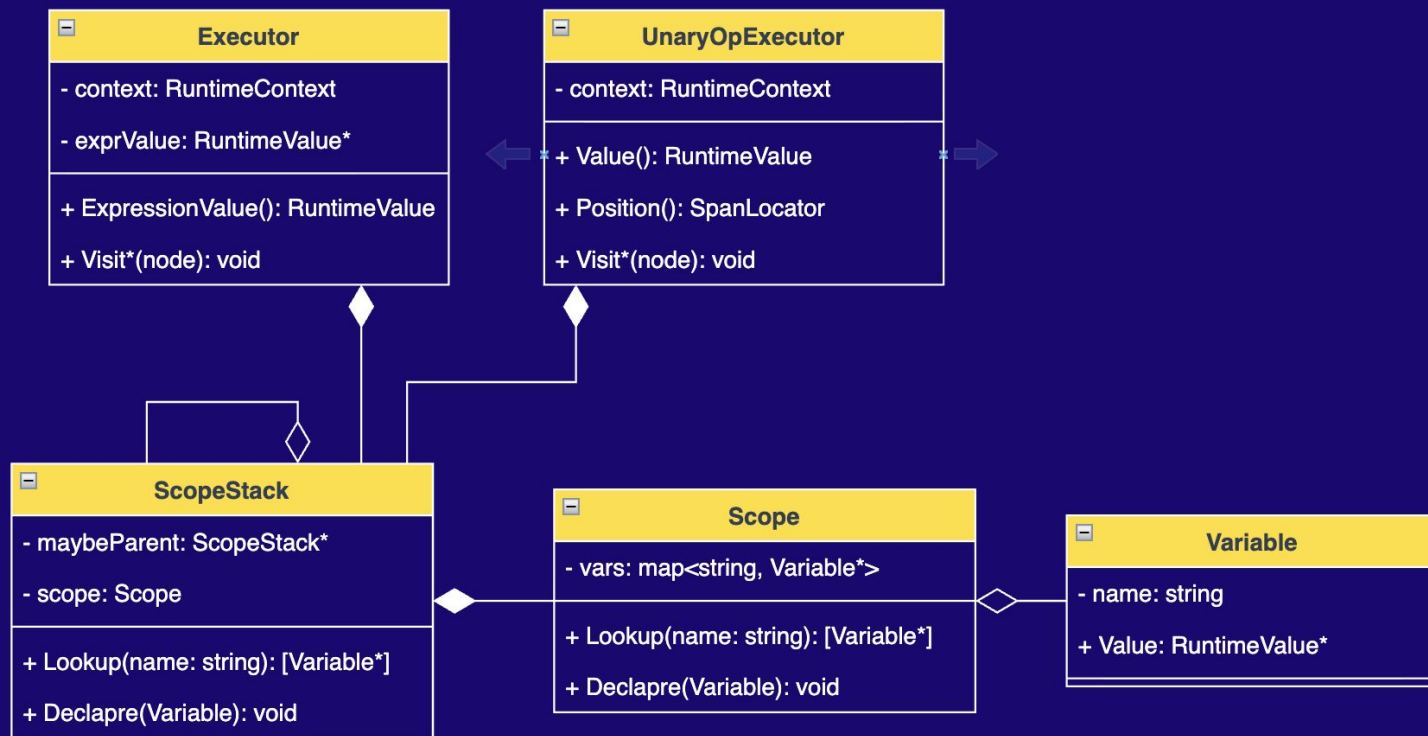

```
var x := 6 + 3 <= 10 < 3 * 5
```

# Interpreter: Implementation Details

# Interpreter: Implementation Details

# Interpreter: Features

- everything from project description
- the input function
- BigInt custom implementation (Karatsuba algorithm)
- reference counting
- informative error reports (error location, stack trace)
- ...

# Interpreter: Features

dinterp - an interpreter for the D language.

Usage: dinterp [OPTIONS] [--] [file1.d file2.d ...]

Options:

--help	-h	Show this text.
--check	-c	Only check for errors, do not run.
--examples		Show some usage examples.
--lexer	-l	Stop after lexical analysis, output the tokens.
--syntaxer	-s	Stop after syntactic analysis, start interactive AST traversal.
--semantics	-S	Stop after semantic analysis, start interactive AST traversal.
--nocontext	-C	Do not show code excerpts below errors.
--notrace	-T	Do not show the call stack traceback on error.

Parameter options:

--callstack	<nonnegative integer>	Set the call stack capacity (default = 1024).
--tracelen	<nonnegative integer>	On error, output at most this many call stack entries (default = 50).

Every argument after -- is assumed to be a file name.
